

The Replicator

The Replicator provides turnkey business continuity protection for windows servers by uniquely acting as **both a failover server and a backup/recovery device**. This fully managed solution offers device-to-device replication or device-to-vault replication for near real-time backups. In the event you lose one of your servers, the Replicator can stand in as a failover server within minutes, keeping your organization running and connected with data as recent as your last 15-minute backup.

Key Product Features Include:

- Block level transfer for more efficient, reliable off site backups
- 15-minute incremental snapshots for more frequent Recovery Point Objectives
- Total Windows server backup preserves OS and applications, not just data
- Restore systems in a fraction of the time of conventional backups
- Multiple replication schemes
- Exchange granular recovery, restore down to the message level
- Rapid failover server virtualization, right on The Replicator
- Industry Standard Encryption to keep your backup safe
- Automatic and non-disruptive with no back-up windows needed on vss aware applications
- Integrated Management and Reporting

Multiple replication schemes are available. The diagram above shows the device-to-device replication option.

Additional features include bare metal restorations to dissimilar hardware, a sandbox environment to test patches, software upgrades and configuration changes before applying them to the production environment, and the ability to run monthly/quarterly/yearly reports without touching the actual production server.

Contact us today at 877-296-4355 or sales@ongoingoperations.com to learn more about how *The Replicator* can help you enhance your business continuity program.
